

## All the Low Mass Objects - Where Do They All Come From?

Stellar mass objects, spinning around form the bulk of the Galaxy's arms.

They have their charms.

Substellar masses, fading away, shining bright in the near infrared,

Theorists said.

*All the low mass objects, where do they all come from?*

*All the low mass objects, where do they all belong?*

College professor, working all night in the dark of the telescope dome,

There all alone.

Uninterrupted, making his plots in the night when there's nobody there.

What does she care?

*All the low mass objects, where do they all come from?*

*All the low mass objects, where do they all belong?*

Other observers study the dust that will form into stars via cores,

What is in store?

Fossilized regions encompass planets and stars and leave nothing concealed,

All is revealed.

*All the low mass objects, where do they all come from?*

*All the low mass objects, where do they all belong?*
